

Individual Contributions by Each Team Member:

- John Rooney - Feed Page
- Caels Kasparek - Login Page
- Matthew Su - Registration Page
- Yuhe Zhou - Database SQL Tables
- Victoria Nawalany - Home Page and Navbar initial versions
- Spencer Jackson - Created initial version of registration page as well as user profile page

What Features Were Completed?

- Registration Page
- Login Page
- Feed Page Layout
- Navigation Bar
- User Profile Page
- Databases for Users and Posts

What Worked During the Demo?

- Navbar connecting all pages except the login page
- Login page has options for the user to login with their username or email
- User Profile and Feed pages displayed correctly
- Registration Page had input checks:
 - Banned words such as “kill or hate”, additional related words for first name, last name, username, userhandle
 - Password/Confirm Password to check for password matching, denied submission if wasn't the case
 - Email required at least an @, will improve functionality later
 - Select public/private account setting during registration

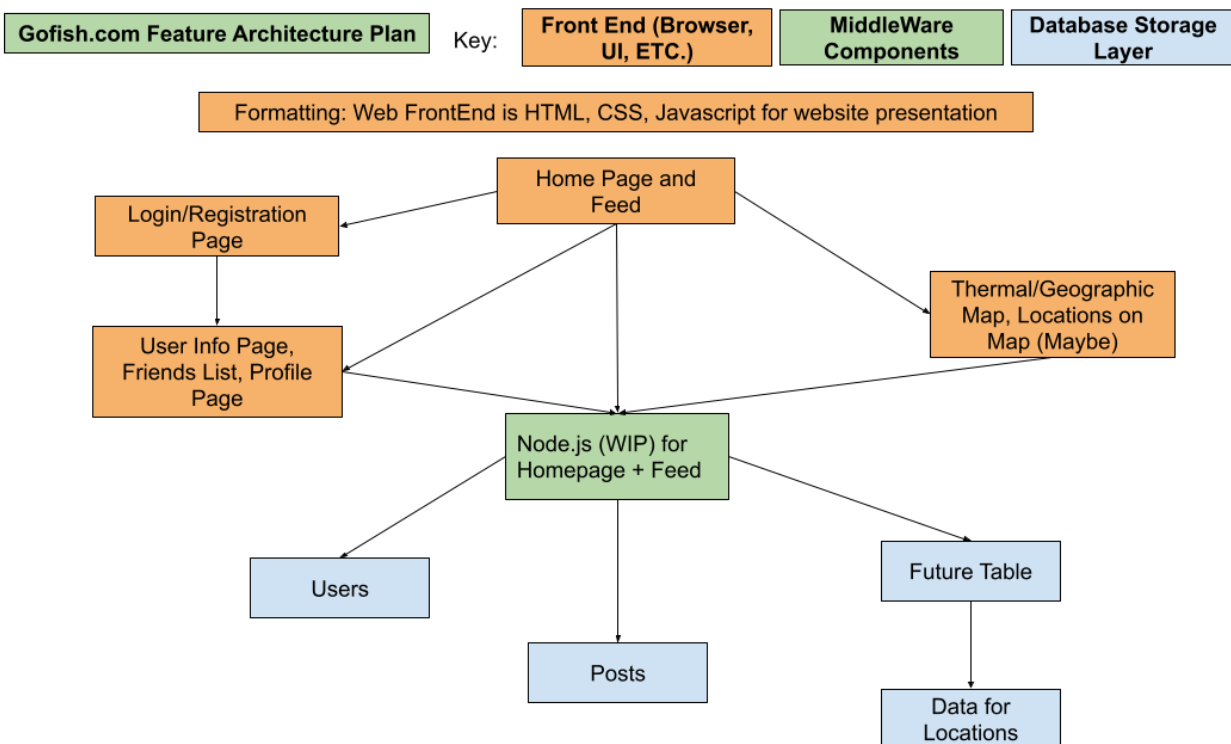

What Issues Were Faced Either During The Development or During the Demo?

- Navbar doesn't link to Login Page
- Universal layout for all pages / consistency
 - The navbar on the login page specifically has a different alignment and font
 - Should be less of an issue once Node.JS is implemented since we can just have a navbar ejs file
- User profile lacked option to add catches
- Unclear how to post and where to edit biggest catch or if that is included from a post

What Were the Suggestions Offered By the TA?

- Save heatmap for end, focus on implementing core functionality of the website
- Add in extra tables and columns for needed information
 - Column for content of post in post table
 - Tables for buddies, catches
 - These should be linked to the users table
- Add modal to allow someone to add catch on user profile page
- Add button to allow adding buddy
- Add button and styling to allow users to create posts
- Add only one Node.js box for the Architecture Design
- Add login link to navbar and pick a consistent design for all the pages
